Concept/Proposal Defense Comments

Project Title: PESO-LINK MISOR: A MOBILE-BASED EMPLOYMENT REGISTRATION AND VALIDATION SUPPORT SYSTEM FOR PESO MISAMIS ORIENTAL

Proponents: Joeremy Christie Ong, Gon Gonos, Vince Roy Lim, Millard Fil Pejana, Bene Gabriel Rosel

Mr. Jhon Paul Tanguamos

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
Include clearer status tracking within the system such as "For Review," "For Interview," "Hired," or "Rejected" to better monitor applicant progress.	Fully Complied	The manuscript was revised to clarify that PESO-Link MisOr supports structured status tracking for PESO-Link application/referral records. The system may display status labels such as Submitted, For Review, PESO-Referred, For Interview, Hired, Rejected, or Closed, depending on the current processing stage and the authorized user who updates the record. The revised workflow explains that PESO Admin can review referral requests, facilitate referral routing, and update referral-related status records. When a referral record is updated, the updated status becomes visible to the job seeker through referral status tracking, and the system generates an in-app notification alert to inform the job seeker that the referral record has been processed or updated. The revision also clarifies that these status updates support applicant progress monitoring within the system but do not replace PESO validation procedures, employer evaluation, interviews, or hiring decisions.	- Pages 15-16, Section 1.5 Scope of the Study - Pages 35-36, Section 2.5 System Workflow - Page 45, Section 3.2 Requirements Gathering and Analysis - Pages 65-67, Section 3.4.5 System Workflow - Page 74, Section 3.5.4 System-Level Functional Requirements

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
Distinguish the concepts of tracking and routing within the system and clarify how applicant monitoring or status flow is handled.	Fully Complied	The manuscript was revised to clearly distinguish routing from tracking within the PESO-Link MisOr workflow. Routing refers to the movement of a PESO referral request from the job seeker to PESO Admin for review and, when endorsed, to the employer for viewing within the system workflow. Tracking refers to the monitoring of the recorded application/referral status after submission, including status updates shown to the job seeker through referral status records and notification alerts. The revised workflow also explains that PESO Admin reviews submitted application/referral records, facilitates referral routing to employers when appropriate, and updates referral-related status records. When a referral status is updated, the system stores the update, displays it through referral tracking, and generates an in-app notification alert for the job seeker. This clarifies how applicant monitoring and status flow are handled without replacing PESO validation procedures or employer hiring decisions.	- Pages 15-16, Section 1.5 Scope of the Study - Pages 35-36, Section 2.5 System Workflow - Pages 44-46, Section 3.2 Requirements Gathering and Analysis - Pages 65-67, Section 3.4.5 System Workflow - Pages 72-74, Sections 3.5.3-3.5.5 Functional Requirements
Clarify whether there are qualification requirements, criteria, or minimum skill matches needed before a job seeker can receive a PESO referral.	...	The manuscript was revised to clarify the current system boundary regarding PESO referral eligibility. The paper states that the system does not compute a numerical match score and does not enforce an automatic minimum skill-match threshold before a job seeker can request PESO referral. Skill matching is limited to displaying matched and missing required skills as a decision-support output. The manuscript also clarifies that a partial or incomplete skill match does not automatically prevent a job seeker from viewing job details, following employer-provided application instructions, or requesting PESO	- Pages 15-17, Section 1.5 Scope of the Study - Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment Platforms - Pages 39-41, Section 3.1.2 System Design - Pages 72-74,

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		referral through the system. Referral requests remain subject to PESO Admin review and existing PESO operational procedures. Since the exact qualification requirements, criteria, or minimum skill-match rules for PESO referral require confirmation from PESO Misamis Oriental, the researchers will clarify this item during a scheduled PESO office consultation before finalizing the corresponding operational rule in the manuscript.	Sections 3.5.3-3.5.5 Functional Requirements
Explain if applicants are still allowed to apply for jobs even when their skills do not fully match the job requirements.	Fully Complied	The manuscript was revised to clarify that skill matching does not function as a screening, blocking, or eligibility mechanism. The system only displays matched and missing required skills based on the comparison between confirmed job seeker skills and job posting requirements. The paper states that a partial or incomplete skill match does not automatically prevent a job seeker from viewing job details, following employer-provided application instructions, or requesting PESO referral through the system. Applications through employer-provided email or instructions remain outside PESO-Link's full tracking capability, while PESO referral requests submitted through the system remain subject to PESO Admin review and existing PESO operational procedures. This clarification ensures that rule-based skill matching is treated only as a decision-support feature and does not replace PESO validation, employer evaluation, interviews, or hiring decisions.	- Pages 15-17, Section 1.5 Scope of the Study - Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment Platforms - Pages 39-41, Section 3.1.2 System Design - Pages 72-74, Sections 3.5.3-3.5.5 Functional Requirements

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
Improve the explanation of the system's contribution and innovation, particularly how the proposed process differs from the existing PESO workflow.	Fully Complied	The manuscript was revised to strengthen the explanation of the system's contribution and innovation by clearly comparing the existing PESO Misamis Oriental workflow with the proposed PESO-Link MisOr workflow. The revised discussion explains that the existing PESO workflow relies on separate channels such as Facebook for job vacancy dissemination, email or PESO referral for applications, manual communication for applicant monitoring, and manual encoding of job seeker information for records and referral processing. In contrast, the proposed system organizes these activities into one mobile-based, system-supported workflow. The manuscript clarifies that the contribution of PESO-Link MisOr is not automated hiring, applicant ranking, or replacement of PESO procedures. Instead, its contribution is the integration of localized mobile access, NSRP-based digital profile encoding, optional OCR-assisted profile encoding, structured job vacancy browsing, employer-provided application instruction viewing, rule-based matched/missing skill indication, PESO referral tracking, notification alerts, and administrative monitoring within one system-supported workflow aligned with existing PESO procedures.	- Pages 10-11, Section 1.1 Background of the Study - Pages 13-15, Section 1.4 Significance of the Study - Pages 31-34, Sections 2.3-2.4 Related Systems and Synthesis - Pages 35-36, Section 2.5 System Workflow - Pages 44-46, Section 3.2 Requirements Gathering and Analysis, Table 2
Further refine the concept and workflow to make the system objectives, contribution, and operational process more understandable and consistent throughout the proposal.	Fully Complied	The manuscript was revised to make the system concept, workflow, objectives, contribution, and operational process more consistent throughout the proposal. The revised sections clarify that PESO-Link MisOr is a mobile-based employment facilitation system that supports structured job vacancy browsing, NSRP-based digital profile encoding, employer-provided application instruction viewing, PESO referral	- Pages 12-13, Section 1.3 Objectives of the Study - Pages 15-18, Sections 1.5-1.6 Scope and Limitations of the Study

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		request submission, referral routing, referral status tracking, notification alerts, employer account management, job posting management, and PESO Admin monitoring. The proposal consistently explains that the system does not replace PESO procedures, employer hiring decisions, PEIS/PhilJobNet, Facebook postings, or employer-email applications. Instead, the system organizes supported PESO-related activities into a role-based workflow for Job Seekers, Employers, and PESO Admin. Job seekers create profiles, browse jobs, view application instructions, request PESO referral, and track referral status. PESO Admin manages accounts, monitors postings, reviews referral requests, facilitates routing, and updates referral-related status records. Employers manage job postings and view PESO-referred applicant records when applicable. The revisions also align the objectives, scope, workflow, system design, and functional requirements by repeatedly defining the system as system-supported rather than fully automated. This makes the operational process clearer while preserving PESO validation authority, employer evaluation authority, and the stated limitations of the study.	- Pages 33-36, Section 2.5 System Workflow - Pages 38-41, Section 3.1 Research Design and Development Methodology - Pages 43-46, Section 3.2 Requirements Gathering and Analysis - Pages 65-67, Section 3.4.5 System Workflow - Pages 69-74, Section 3.5 Functional Requirements
The panel appreciated the detailed documentation and prototype presentation; however, clearer technical explanations and workflow justifications are still needed.		The manuscript was revised to provide clearer technical explanations and workflow justifications for the proposed PESO-Link MisOr system. The revisions explain the system's main technical components, including Android-focused mobile development using React Native with Expo, a Node.js Express backend, a MySQL database, NSRP-based digital profile encoding, optional OCR-assisted NSRP form-to-profile auto-fill, rule-based skill matching, PESO referral routing,	- Pages 15-18, Sections 1.5-1.6 Scope and Limitations of the Study - Pages 35-36, Section 2.5 System Workflow - Pages 38-41,

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		referral status tracking, and in-app notification alerts. The workflow justification was also strengthened by explaining how the system responds to the validated PESO workflow issues. Fragmented job posting access is addressed through structured and localized job vacancy browsing. Limited application or referral status visibility is addressed through PESO-Link referral tracking and notification alerts. Manual and decentralized coordination is addressed through PESO Admin review, referral routing, employer account management, and job posting monitoring. Repetitive NSRP-related data handling is addressed through NSRP-based digital profile encoding with optional OCR assistance. The manuscript further clarifies that the system remains system-supported rather than fully automated. PESO validation, referral judgment, employer evaluation, interviews, and hiring decisions remain under authorized human users. This makes the technical explanation and workflow justification clearer while avoiding unsupported claims such as automated hiring, applicant ranking, AI-based screening, or direct integration with external government systems.	Section 3.1 Research Design and Development Methodology - Pages 43-46, Section 3.2 Requirements Gathering and Analysis - Pages 53-55, Section 3.4.1 System Architecture - Pages 65-67, Section 3.4.5 System Workflow - Pages 69-74, Section 3.5 Functional Requirements - Pages 75-78, Section 3.6 Software and Hardware Requirements

Clarify the meaning of "Skills Matching" in the study and avoid using unexplained	Fully Complied	The manuscript was revised to clarify the meaning of "skill matching" in the study. Skill matching is defined as the rule-based comparison of confirmed job seeker skills from the NSRP-based	- Pages 9-10, Section 1.1 Background of the Study

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
abbreviations or terms that may confuse readers or panelists.		profile with the required skills encoded in a job posting. The system identifies which required skills are matched and which required skills are missing. The revised manuscript avoids treating skill matching as artificial intelligence, automated screening, applicant ranking, recommendation, or hiring decision-making. It also clarifies that no numerical match score or automatic minimum skill-match threshold is computed by the system. The output is limited to matched and missing required skills and functions only as a decision-support feature for job seekers, PESO personnel, and employers. The manuscript also explains related terms such as NSRP and OCR in their relevant sections to avoid confusing readers and panelists. OCR is described as optional NSRP form-to-profile auto-fill, while skill matching is explained as a separate rule-based comparison using confirmed profile skills and job posting requirements.	- Pages 15-17, Section 1.5 Scope of the Study - Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment Platforms - Pages 33-34, Section 2.4 Synthesis - Pages 39-41, Section 3.1.2 System Design

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
Include a detailed discussion of the current manual process in Chapter 3 and clearly compare it with the proposed automated process.	Fully Complied	The manuscript was revised to include a clearer discussion of the current manual PESO Misamis Oriental workflow in Chapter 3 and to compare it directly with the proposed PESO-Link MisOr system-supported workflow. The revised Chapter 3 explains that the current workflow uses Facebook and related online channels for job vacancy dissemination, employer-provided email or PESO referral for application submission, manual communication through email, SMS, calls, or direct coordination for applicant and referral monitoring, and manual encoding of job seeker information for records and referral processing. The manuscript also includes a comparison table showing how the proposed system differs from the current manual process. In the proposed workflow, job postings are organized within the mobile application, PESO referral requests submitted through PESO-Link are recorded and tracked, PESO Admin can review referral requests and update referral-related status records, job seekers create NSRP-based digital profiles, and optional OCR-assisted NSRP form-to-profile auto-fill may assist encoding. The revision clarifies that the proposed process is system-supported rather than fully automated, since PESO validation, referral judgment, employer evaluation, interviews, and hiring decisions remain under authorized human users.	- Pages 43-46, Section 3.2 Requirements Gathering and Analysis - Pages 44-46, Section 3.2 Requirements Gathering and Analysis, Table 2 - Pages 65-67, Section 3.4.5 System Workflow - Pages 69-74, Section 3.5 Functional Requirements
Strengthen the methodology by clearly explaining the workflow and logic behind the		The manuscript was revised to strengthen the methodology by clearly explaining the workflow and logic behind the skill matching feature. The revised methodology states that skill	- Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
skills matching feature.	Fully Complied	matching begins only after the job seeker has completed or confirmed the skills stored in the NSRP-based profile. Confirmed skills may come from manual encoding or OCR-assisted extraction, but OCR-extracted skills are not used for matching unless they are reviewed, edited if necessary, and confirmed by the user. The manuscript explains the matching logic as a rule-based comparison process. First, the system retrieves the confirmed skills from the job seeker's NSRP-based profile. Second, it retrieves the required skills encoded in the selected job posting. Third, each required skill is compared against the confirmed job seeker skills. Fourth, the system classifies present required skills as matched skills and absent required skills as missing required skills. The result is then displayed to the user as matched and missing required skills. The revised explanation also clarifies that the skill matching feature does not compute a numerical match score, enforce a minimum skill-match threshold, rank applicants, recommend applicants, screen applicants, approve referrals, or make hiring decisions. The feature functions only as a decision-support output within the system workflow.	Platforms - Pages 33-34, Section 2.4 Synthesis - Pages 39-41, Section 3.1.2 System Design - Pages 72-74, Sections 3.5.3-3.5.5 Functional Requirements
Present the actual matching algorithm or matching process used in the system, particularly how OCR-extracted skills are compared and matched with job requirements.		The manuscript was revised to present the actual matching process used in the system. The matching process begins only after the job seeker has completed or confirmed the skills stored in the NSRP-based profile. If OCR is used, the extracted skills are treated only as temporary pre-filled data and are not used for matching unless the job seeker reviews, edits if necessary, and confirms them. The revised manuscript explains that the system retrieves the confirmed skills from the job seeker's NSRP-based	- Pages 15-17, Section 1.5 Scope of the Study - Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment Platforms - Pages 39-41,

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		profile and compares them with the required skills encoded in the selected job posting. Each required skill is checked against the confirmed job seeker skills. If the required skill is present, it is classified as a matched skill. If it is not present, it is classified as a missing required skill. The system then displays the matched and missing required skills to the user. The manuscript also clarifies that the matching process does not compute a numerical match score, enforce a minimum skill-match threshold, rank applicants, recommend applicants, screen applicants, approve referrals, or make hiring decisions. This ensures that OCR-assisted extraction and skill matching remain assistive and decision-support features only.	Section 3.1.2 System Design - Pages 65-67, Section 3.4.5 System Workflow - Pages 72-74, Sections 3.5.3-3.5.5 Functional Requirements
Explain how role-based or skills-based matching is integrated into the proposed system architecture and workflow.		The manuscript was revised to explain how role-based system functions and skill matching are integrated into the proposed system architecture and workflow. The system defines three primary user roles: Job Seeker, Employer, and PESO Admin. Job seekers create NSRP-based profiles, browse job postings, view employer-provided application instructions, request PESO referral, and track referral status. Employers manage job postings and view PESO-referred applicant records when applicable. PESO Admin manages accounts, monitors job postings, reviews PESO referral requests, facilitates referral routing, and updates referral-related status records. The manuscript also clarifies that skill matching is integrated after NSRP-based profile creation and confirmation. The system compares confirmed job seeker skills from the NSRP-based profile with the required skills encoded in a job posting. The output is limited to matched and missing required skills and is shown as	- Pages 15-17, Section 1.5 Scope of the Study - Pages 35-36, Section 2.5 System Workflow - Pages 39-41, Section 3.1.2 System Design - Pages 53-55, Section 3.4.1 System Architecture - Pages 65-67, Section 3.4.5 System Workflow - Pages 69-74, Section 3.5 Functional

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		a decision-support result within the job posting and referral workflow. The revised explanation distinguishes role-based access and workflow functions from skill matching. Role-based functions determine what each user type can access and perform in the system, while skill matching determines how confirmed job seeker skills are compared with job requirements. The system does not use skill matching to automatically approve referrals, rank applicants, screen applicants, or make hiring decisions.	Requirements
Clearly identify the existing study, framework, or methodology that serves as the basis or anchor for the system's skills matching approach.		The manuscript was revised to clearly identify the basis of the system's skill matching approach. The discussion anchors the proposed skill matching mechanism on the basic keyword-based or similarity-based comparison approach discussed by Modak et al. (2024), where applicant qualifications and job requirements are compared using keyword-based or similarity-based methods. The manuscript also differentiates the proposed approach from the skill-based filtering approach demonstrated in JOFS by Adaza et al. (2018), which filters applicants or jobs based on skill-related criteria. In PESO-Link MisOr, the adopted approach is limited to rule-based keyword comparison between confirmed NSRP-based job seeker skills and the required skills encoded in job postings. The revised explanation clarifies that the system only displays matched and missing required skills. It does not compute a numerical match score, enforce a minimum skill-match threshold, rank applicants, recommend applicants, screen applicants, approve referrals, or make hiring decisions. This ensures that the skill matching approach is properly grounded in	- Pages 21-24, Section 2.1.4 Skill-Based Job Matching in Employment Platforms - Pages 31-34, Sections 2.3-2.4 Related Systems and Synthesis - Pages 39-41, Section 3.1.2 System Design

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
		related literature while remaining aligned with the system's decision-support limitation.	
Improve the discussion of system integration, particularly how OCR, digital profile encoding, skills matching, and referral generation work together within the system.		The manuscript was revised to improve the discussion of system integration by explaining how OCR-assisted encoding, NSRP-based digital profile creation, skill matching, and PESO referral generation work together in one sequential workflow. The revised manuscript explains that the job seeker first creates an NSRP-based digital profile either through manual encoding or optional OCR-assisted NSRP form-to-profile auto-fill. If OCR is used, the extracted information is treated only as temporary pre-filled data until the user reviews, edits if necessary, and confirms it. Once confirmed, the profile information, including confirmed skills, is saved as the job seeker's NSRP-based digital profile. After profile confirmation, the system compares the confirmed job seeker skills with the required skills encoded in a selected job posting and displays the matched and missing required skills. The job seeker may then view employer-provided application instructions or request PESO referral through the system. When a PESO referral request is submitted, the system generates a PESO-Link application/referral record connected to the job seeker profile, selected job posting, and referral status tracking workflow. The revision clarifies that these components are integrated to support profile encoding, skill alignment visibility, and referral tracking, without automatically screening applicants, approving referrals, ranking applicants, recommending applicants, or making hiring decisions.	- Pages 15-17, Section 1.5 Scope of the Study - Pages 21-24, Sections 2.1.3-2.1.4 OCR and Skill-Based Job Matching - Pages 39-41, Section 3.1.2 System Design - Pages 53-55, Section 3.4.1 System Architecture - Pages 65-67, Section 3.4.5 System Workflow - Pages 69-74, Section 3.5 Functional Requirements

Reviewer Comment	Compliance Status	Revised Justification / Action Taken	Where Found in the Manuscript
Clarify the workflow of the PESO referral process, especially how job seekers are notified once referrals are approved or processed by the PESO office.	...	The manuscript was revised to clarify the proposed PESO-Link MisOr referral workflow within the system. A PESO referral request is created when a job seeker submits a referral request for a selected job posting through the mobile application. The system stores the request as a PESO-Link application/referral record connected to the job seeker profile and selected job posting. The revised workflow explains that PESO Admin reviews the submitted referral request, facilitates referral routing when appropriate, and updates the referral-related status record according to the processing stage. Once the referral record is updated by an authorized user, the updated status becomes visible to the job seeker through referral status tracking, and the system generates an in-app notification alert to inform the job seeker that the referral record has been processed or updated. The manuscript also clarifies that the system-supported referral workflow does not replace PESO validation procedures, official referral judgment, employer evaluation, interviews, or hiring decisions. However, the exact current PESO office procedure for notifying job seekers after referral approval or processing will still be confirmed during the scheduled PESO office consultation to avoid unsupported claims about official communication channels, approval terms, or notification practices.	- Pages 15-16, Section 1.5 Scope of the Study - Pages 35-36, Section 2.5 System Workflow - Pages 43-46, Section 3.2 Requirements Gathering and Analysis - Pages 65-67, Section 3.4.5 System Workflow - Page 74, Section 3.5.4 System-Level Functional Requirements
